TRAFFIC SPEED REPORT NO. 89

TO: J. F. McLaughlin, Director
Joint Highway Research Project

December 28, 1971

File: 8-3-3

FROM: H. L. Michael, Associate Director
Joint Highway Research Project

Project: C-36-10C

The attached Progress Report No. 89 on Traffic Speeds is the report of the 1971 study of free-flowing automobile and truck speeds on rural, tangent, level sections of Interstate, 4-lane and 2-lane highways in Indiana. The report has been prepared by Mr. W. K. Law, a Graduate Instructor in Research on our staff, under the direction of Professor H. L. Michael. The data were collected by Messrs. G. K. Stafford and Bronson Luttrell of our staff.

The results indicate a decrease of 0.60 mph in the average speed of all passenger cars and an increase of 0.37 mph for heavy trucks to that of the 1970 study. A simple linear regression analysis over the last eleven years indicated that there has been an increasing trend in speed for most classifications of vehicles and highways of between 0.5 and 1.0 mph per year. Speed values for the past few years, however, indicate that the increasing trend for that period may not have been as great.

Copies of this report are requested for release to the Indiana State Police, the Indiana Traffic Safety Council and the Indiana Office of Traffic Safety as is normal procedure for these reports. Copies will also be sent to the Bureau of Public Roads and several departments within the ISHC. The report is presented for the record and for release as noted.

Respectfully submitted,

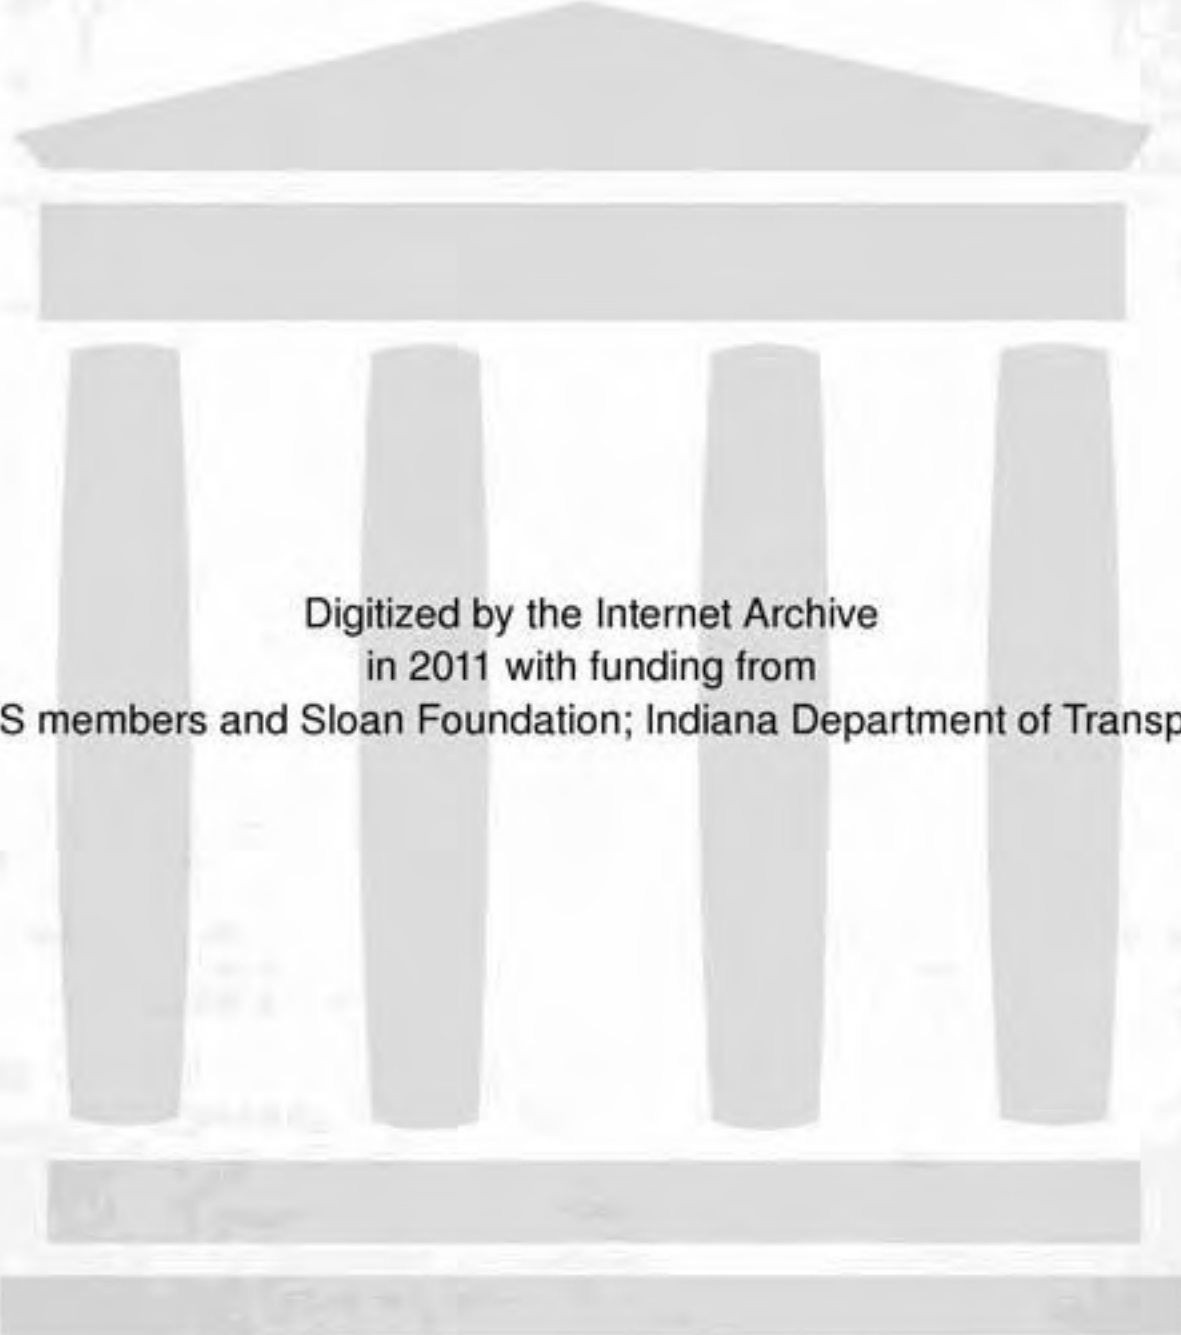

Harold L. Michael
Associate Director

ABSTRACT

This report is the annual continuing study of the speeds of vehicles on rural Indiana highways. Observations of spot speeds were taken on interstate, four-lane, and two-lane highways throughout the state during the months of June, July and August, 1971.

Analysis of the speeds showed the overall average speed for passenger cars was 64.9 miles per hour. The overall average speed for trucks was 57.9 miles per hour. This was 0.60 mph less for passenger cars and 0.37 miles more for trucks than similar data given for 1970 at the same locations.

TRAFFIC SPEED REPORT NO. 89

This report is an analysis of spot speed observations made during June, July and August 1971. All observations were made of free-flowing vehicles on level, tangent sections of rural Indiana highways during daylight and under favorable conditions. The same locations on selected Federal and State highways as used in 1970 were used again. Except for Station 9, these locations have been the same for many years and for 1971 were the same everywhere as for 1970. Stations were classified as two-lane, four-lane, or interstate highways. A representative sample of spot speeds was obtained at each of the four stations in each classification. The site locations were as follows: (See Figure A)

Interstate Highways

- | | |
|---------|--|
| 1. I-69 | 3.3 miles south of Junction of SR 18 |
| 2. I-65 | 1.0 mile west of Junction of SR 334 |
| 3. I-74 | 1.0 mile east of Junction of Post Road |
| 4. I-65 | 7.5 miles north of Junction of SR 160 |

Four Lane Highways

FIG. A - LOCATIONS OF SPEED-STUDY STATIONS

The vehicles were classified as Indiana or Non-Indiana Passenger Cars and Light (less than 5000 lbs. gross weight) or Heavy (equal to or more than 5000 lbs. gross weight) Trucks. The analysis was performed as classified and combined, passenger cars or trucks.

The maximum speed limits in Indiana are as follows: 70 miles per hour on interstate highways and 65 miles per hour on other rural highways unless otherwise posted. The stated limits were applicable at all stations of this study.

Equipment and Field Procedure

The observations for this study were obtained by use of an "Electromatic" Radar Speed Meter. The meter was placed approximately four feet from the edge of the pavement at angles less than 10° with the highway center line. No corrections of speeds were necessary at these small angles. At the beginning of the study the accuracy of the meter was checked and any constant discrepancy of readings was corrected accordingly.

Results of Analysis

The data collected were analyzed and are summarized in Tables 1 to 12 in the Appendix. Tables 13, 14, and 15 summarize the data for interstate, four lane, and two lane highways, respectively. Table 16 is the summary for all highways.

Figures 1 to 16 in the Appendix show the accumulative speed curves for each of the stations studied and the combined curves for the three types of highways and all highways observed.

The average speed for each classification of vehicles on each type of highway for this study was as follows:

	<u>Interstate</u>	<u>Four Lane</u>	<u>Two Lane</u>
<u>Passenger Cars:</u>			
Indiana	68.3	64.3	61.4
Non-Indiana	68.7	65.4	60.9
85 Percentile (all)	73.7	70.7	68.0
<u>Trucks:</u>			
Less than 5000 lbs.	64.8	59.8	58.0
5000 lbs or more	59.4	56.4	54.0

The percent of vehicles exceeding the speed limit for each classification of vehicle and each type of highway was as follows:

	<u>Interstate</u>	<u>Four Lane</u>	<u>Two Lane</u>
<u>Passenger Cars:</u>			
Indiana	37.9	44.3	26.2
Non-Indiana	40.9	48.8	21.0
<u>Trucks:</u>			
Less than 5000 lbs.	24.3	24.8	12.4
5000 lbs or more	1.9	4.9	2.7

The percent of vehicles traveling 5 mph or more above the speed limit for each case was as follows:

	<u>Interstate</u>	<u>Four Lane</u>	<u>Two Lane</u>
<u>Passenger Cars:</u>			
Indiana	9.4	6.5	10.0
Non-Indiana	7.8	4.2	5.7
<u>Trucks:</u>			
Less than 5000 lbs.	4.5	5.0	5.1
5000 lbs or more	0.0	0.0	0.8

The results of this study and similar studies conducted since 1961 are tabulated in Table A. A simple linear regression analysis on these results was conducted and a summary is given in Table B.

A linear relationship between speeds and year was assumed with B the estimated slope of the straight line. Three hypotheses were tested - $\beta = 0.5$, $\beta = 1.0$, and $\beta = 1.5$ - in order to place values on the annual trends. It was found that an increase of a 1.0 mph/year trend existed for all except two cases at the 95% confidence level. The two exceptions were 4-lane and 2-lane heavy truck's 15-percentile speeds which showed a 0.5 mph/year trend.

A graphical representation of Tables A and B is given in Figure B.

Rej = H_0 rejected; NR = H_0 not rejected.

FIG. B - INDIANA RURAL SPEED TRENDS

Summary and Conclusions

The average speeds in this study were found to be 0.60 mph slower for passenger cars and 0.37 mph faster for heavy trucks than the results of the previous year.

The simple linear regression on the results of the past eleven years (1961-1971) concluded at 95% confidence level that:

1. There has been a 1.0 mph/year average annual speed increase for the following seven classifications:
 - a. Interstate Passenger Cars 85-percentile,
 - b. 4-lane Passenger Cars 85-percentile,
 - c. 2-lane Passenger Cars 85-percentile,
 - d. Mean of All Passenger Cars,
 - e. Mean of All Light Trucks,
 - f. Mean of All Heavy Trucks, and
 - g. Interstate Heavy Trucks 15-percentile.
2. Two cases showed a smaller increase of 0.5 mph/year:
 - a. 4-lane Heavy Trucks 15-percentile, and
 - b. 2-lane Heavy Trucks 15-percentile.
3. The speeds of the past four years indicate that the increase during this period may not have been as great as during the period 1961-1967.

The increase in mileage of high type highways such as the Interstate System and the growing percentage of passenger cars violating current maximum speed limits tend to support the belief that drivers select the travel speeds they consider safe irrespective of maximum speed limits.

APPENDIX A
Determination of Sample Size

Determination of Sample Size

It was desired that a 95% confidence interval of the true mean of the speeds of passenger cars should not be wider than 2 mph. For trucks weighing 5,000 lbs. or more a 95% confidence interval with a 4 mph band was desired.

Assuming a normal distribution of speeds and using the standard deviation of the grouped data of the 1970 study, the minimum sample size requirements were determined by

$$N = \left[\frac{2ts}{L} \right]^2$$

where N = sample size required
 t = tabulated "t" value for 5% level
 s = estimated standard deviation
 L = band width of confidence interval

For Passenger Cars:

$$N = \left[\frac{2 \times 1.96 \times 7.55}{2} \right]^2 = 219 \text{ observations}$$

For (Heavy) Trucks:

$$N = \left[\frac{2 \times 1.96 \times 6.30}{4} \right]^2 = 38 \text{ observations}$$

NOTE:

At all stations, more than 238 passenger car observations and 52 heavy truck observations were obtained for the study reported herein.
